                                                The patent discloses a method for producing plants resistant to gall disease, induced by Agrobacterium infection, by transformation with a bacterial resistance (BR) construct capable of eliciting co-suppression. The construct encodes an untranslatable RNA molecule, that is highly homologous to the tumour or gall disease-causing genes iaaM, iaaH and ipt of Agrobacterium tumefaciens. These oncogenes are modified by introduction of premature termination codons or frameshift mutations, to inhibit their expression. This method is used to reduce susceptibility of plants to gall diseases. The present DNA sequence is the Agrobacterium tumefaciens T-DNA (transferred DNA) gene ipt, required for cytokinin production. It encodes an enzyme that converts adenosine monophosphate (AMP) into isopentenyl adenosine monophosphate, a cytokinin. The overproduction of these plant growth hormones results in gall formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            iaaM; iaaH; ipt; T-DNA; transferred DNA; gall-qlsease resistance; and bacterial resistance construct; untranslatable RNA; tumour; oncogene; cytokinin; plant growth hormone; ds.

The patent discloses a method for producing plants resistant to gall disease, induced by Agrobacterium infection, by transformation with a construct encodes an untranslatable RNA molecule, that is highly the construct encodes an untranslatable RNA molecule, that is highly in the fumour or gall disease-causing genes iaaM, iaaH and ipto Agrobacterium tumefaciens. These oncogenes are modified by continuous to the tumour or gall disease-causing genes iaaM, iaaH and ipto function of premature termination codons or frameshift mutations, to inhibit their expression. This method is used to reduce susceptibility of plants to gall diseases. The present DNA sequence is the Agrobacterium tumefaciens T.DNA (transferred DNA) mutant ipt gene. The wild type ipt gene was modified by deletion of 5 cytosine of the third codon and substitution of 3 guanine of the third codon with an admine. This substitution of 3 guanine of the third codon with and transformed cuntranslatable dsRNA vectors, that reduce gall formation in transformed resistant plants generated by transforming cells with an anslatable nucleic acid homologous to a gall disease-causing Page 43; 49pp; English 98US-0107185P acid homologous iaaH and ipt

gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Arabidopsis thaliana.
                                                                                                                                      (AAT42919) from an Arabidopsis thaliana senescence-associated gene. The sequence also contains part of the SAG12-1 gene 5'-untranslated region. The sequence has all regulatory signals required for senescence-specific gene expression, and may be operably linked to a cytokinin biosynthesis isopentenyltransferase gene in a vector for expression in a transgenic plant. The resulting transgenic plant shows delayed senescence, and shows longer vegetative growth, producing more flowers, seeds or fruit

The senescence associated promoters are useful for the creation of transgenic plants with altered senescence characteristics. Genetic constructs can be inserted into plants which become effective only upon plant cells entering senescence. For example, a gene encoding a biosynthetic enzyme under the control of a senescence-specific promoter can be inserted into a plant, without having the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel senescence associated promoter sequence connected to coding DNA sequence useful for the creation of transgenic paltered senescence characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  tissues of the plant exposed to the excess of cytokinin during preseneescence growth. Then at the onset of senescence, the senescence specific promoter activates cytokinin production to alter the progression of senescence in the plant. The present sequence is Arabidopsis thaliana
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           29-MAR-1995;

03-OCT-2002
19-MAR-1991
                                                                tmr is a designation for a gene which codes for a cytokinin biosynthetic enzyme and which can be found in the EcoRI fragment of the Agrobacterium tumefaciens Ti plasmid. tzs is a designation for a gene which codes for a cytokinin biosynthetic enzyme and which can be found in or near the vir region of the Agrobacterium tumefaciens Ti plasmid pTiC58. ptz is a designation for a gene which codes for a cytokinin biosynthetic enzyme and which can be found in the larger (105 kb) plasmid of P. savastanoi strain 1006. When tmr and tzs are included in the same plasmid, there is a good increase in trans-zeatin yield. (Updated on 03-OCT_2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   tumefaciens

                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an artificial nucleic acid construct comprising a bi-directional promoter having a minimal promoter operably linked in opposite orientation 5' to a common promoter, where each promoter is either cauliflower mosaic virus (CaNV) 35S RNA promoter (35S), peanut chloritic streak caulimovirus full length transcript promoter (PCISV). Arabidopsis 12-oxophytodienoic acid-100, 11-reductase gene promoter (OPR or SAG12, and where each end of the bi-directional promoter is operably linked to a polynucleotide encoding a polypeptide. The construct is used to produce a transgenic plant which has an agronomically-significant trait. The present sequence is pGL471 construct comprising SAG12-35S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bi-directional promoter with common promoter linked in opposite orientation to minimal promoter, useful to direct expression of polynucleotide which confers agronomically significant trait to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2002-442888/47.

                                                                                                                                                                                                                                                                        expression in plant seed operatively linked to a cytokinin modulating gene. The recombinant DNA molecules are useful for producing fertile, transgenic plants capable of regulated expression of a cytokinin modulating gene in developing seeds. They are also useful for improving stress tolerance and yield stability in plants. The preferential expression of recombinant DNA molecules of the invention occurs about 14-25 days after pollination. The transgenic plants thus produced have enhanced levels of cytokinin expression exhibit improved seed size, decreased tip kernel abortion and increased seed set during unfavourable environmental conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    temporal gene expression; spatial gene expression; plant seed; cytokinin modulating gene; transgenic plant; seed size; stress tolerance; yield stability; tip kernel abortion; seed set; isopentenyl transferase;

Novel recombinant DNA

construct useful for producing transgenic

plants

having enhanced levels of cytokinin expression, improved stress tolerance and yield stability. Page 16;

The present sequence represents an isopentenyl transferasegene fragment. The fragment was used to produce the recombinant DNA molecules of the invention. These comprise a genetic construct consisting of a promoter directing temporal and/or spatial gene expression in plant seed operatively linked to a cytokinin modulating gene. The recombinant DNA molecules are useful for producing fertile, transgenic plants capable of regulated expression of a cytokinin modulating gene in developing seeds. They are also useful for improving stress tolerance and yield stability in plants. The preferential expression of recombinant DNA molecules of the invention occurs about 14-25 days after pollination. The transgenic plants thus produced have enhanced levels of cytokinin expression exhibit improved seed size, decreased tip kernel abortion and increased seed set during unfavourable environmental conditions

Sequence 721 BP; 182 A; 176 C; 191 G; 172 T; 0 U; 0 Other;

No. is the number of results predicted by chance to a score greater than or equal to the score of the result bein and is derived by analysis of the total score distribution.
